Dynamic Team Page

The task that has been given to me is for me to make a dynamic team page for the contributing members of my Final Integrated Project. For my Final Integrated Project (FIP) I worked by myself, so I was unable to have anyone else help me with this project. I first will need to download a copy of my repository via GitHub clone and design the html. This should not be too hard as I am a speedy coder with HTML. Next, I will add some CSS to style the webpage. I will also add some JS code to fulfill the requirements for this assignment. My plan is to have a button for me and the partner that I will make up. These buttons will control the page. When you click on the button designated for me, the button will load the information that is correlated to me. When you click the button for my imaginary partner, the content that I will make for him will load and take the place of mine. I will accomplish this by making an array that will hold all the content that I wish to put onto the page. Once I have completed all the requirements, I will push all of my content back into GitHub and merge the information into the main branch, making my work submission ready.
